1. Rekursija (L1)

1.1. Darbo užduotis

LD_14.Salos.

Robotas iš didelio aukščio nufotografavo stačiakampį Žemės paviršiaus plotą. Gautas vaizdas buvo sudalintas kvadratiniais langeliais $n \times m$ ($1 \le n$, $m \le 100$). Langelis tamsus, jeigu jis atitinka sausumos dalelę ir šviesus, jeigu atitinka vandens plotelį.

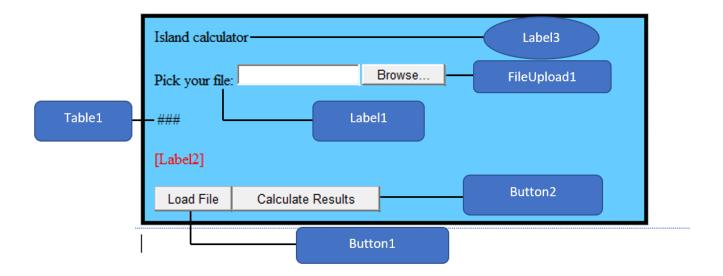

Parašykite programą, kuri suskaičiuotų, kiek yra salų ir kokio dydžio didžiausia sala. Sala – tai gretimų tamsių langelių visuma, iš visų pusių apribota šviesiais. Sala taip pat laikoma tamsių langelių visuma, esanti ant nufotografuoto ploto ribos (ne iš visų pusių supa vanduo). Programa turi analizuoti k $(1 \le k \le 10)$ tokių žemės plotų nuotraukų.

Duomenys surašyti tekstiniame faile U3.txt, kur pirmoje eilutėje yra k. Toliau – kiekvieno stačiakampio duomenys: pirmoje stačiakampio aprašo eilutėje yra n ir m reikšmės, o kitose eilutėse – stačiakampio langelių reikšmės eilutėmis. Tamsų langelį atitinka simbolis '1', o šviesų '0'.

Rezultatai. Spausdinkite kiekvienoje eilutėje po du skaičius: kiekvieno paviršiaus ploto salų skaičių ir didžiausios salos langelių skaičių.

Fotografijos pavyzdys	U3.txt	Rez.
Fotografija 10 x 7 prieš ją koduojant skaitmenimis (faile trečia koduotė)	3 2 6 110100 000000 9 4 1000 0110 1100 1100 1100 1010 1010 10	2 2 3 8 4 10

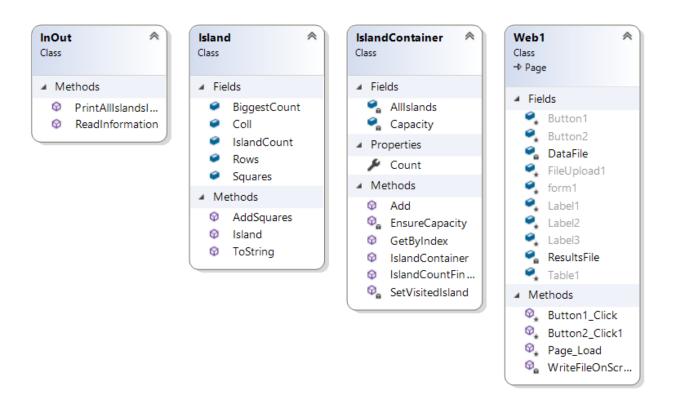

1.2. Grafinės vartotojo sąsajos schema

1.3. Sąsajoje panaudotų komponentų keičiamos savybės

Komponentas	Savybė	Reikšmė
FileUpload1		
Label1	Text	Pick your file:
Label2	Text	File you chose was the wrong type or you didn't chose a file, try again !!!
Label2	Text	Calculations couldn't be made. The information inside of the file was the wrong format !!!
Label3	Text	Island calculator
Button1	Text	Load File
Button1	OnClick	Pavaizduoti pradinius duomenis ir įrašyti į duomenų "U3.txt" failą
Button2	Text	Calculate Results
Button2	OnClick	Apskaičiuoti rezultatus, juos įrašyti ir juos pavaizduoti ekrane
Button2	Visible	False
Table1	GridLines	

1.4. Klasių diagrama

1.5. Programos vartotojo vadovas

Paleidžiama programa. Paspaudus mygtuką "Choose File", pasirenkame ".txt" tipo failą, kurio pirmoje eilutėje yra vienas skaičius ($1 \le n \le 10$), nurodantis, kiek yra žemės plotų nuotraukų. Tolesnėse eilutėse tiek, kartų, kiek daryta nuotraukų, turi būti užrašytas darytos nuotraukos plotis ir ilgis ($1 \le n$, m ≤ 100) ir žemės nuotrauka, nurodyto pločio ir ilgio, sudaryta iš vienetų – žemės plotelių, nulių – vandens plotelių. Pvz :

Pasirinkus failą spaudžiame mygtuką "Load File", kad galėtume pamatyti pasirinktą failą ekrane. Po sėkmingo "Load File" mygtuko paspaudimo atsiras dar vienas mygtukas "Calculate results", jį paspaudus ekrane matysite rezultatus, rodančius kiek, kiekvienoje nuotraukoje yra salų ir kokio dydžio yra didžiausia sala. Rezultatai, taip pat bus išsaugoti dokumente "Rezultatai.txt"

1.6. Programos tekstas

Rezultatai.txt (Failas, nebuvo sukurtas)

1.8. Dėstytojo pastabos

2. Dinaminis atminties valdymas (L2)

2.1. Darbo užduotis

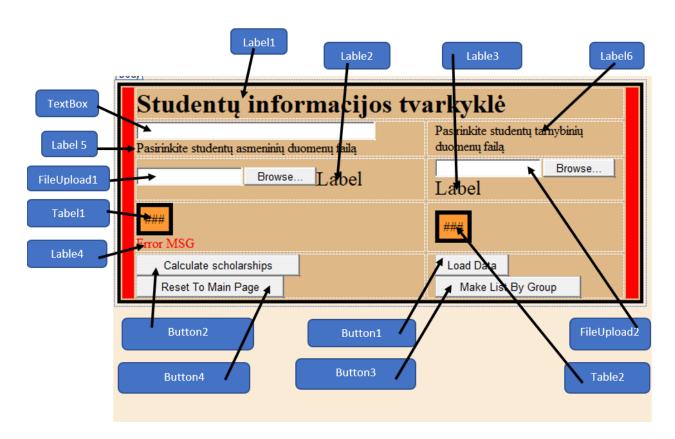

LD_14. Stipendijos. Studentų stipendijoms yra skiriamas nurodyto dydžio fondas. Studentui skiriama stipendija, jei jo pažymių vidurkis viršija nurodytą dydį ir jis neturi skolų (visi pažymiai >4). Studentui skiriama 10% didesnė stipendija, jei jo visi pažymiai didesni už 8. Toks studentas vadinamas pirmūnu. Paskirstykite studentams stipendijas pagal duotą fondą. Fondą reikia maksimaliai išnaudoti, bet negalima viršyti fondo dydžio.

Duomenys:

- Tekstiniame faile U14a.txt duoti studentų asmeniniai duomenys: studento eilės numeris, pavardė vardas, telefono numeris.
- Tekstiniame faile U14b.txt pateikta studentų tarnybinė informacija. Pirmojoje failo eilutėje nurodytas stipendijų fondo dydis ir pažymių vidurkis stipendijai gauti. Tolimesnėse eilutėse tokia informacija: studento eilės numeris, kuris sutampa su eilės numeriu U14a.txt faile, grupė, pažymių kiekis, pažymiai.

Spausdinamas sąrašas (studento pavardė, vardas, pažymiai, stipendijos dydis) turi būti surikiuotas pagal stipendijų dydį, pavardes ir vardus. Iš sąrašo pašalinkite studentus, kurie negauna stipendijos. Sudarykite ir atspausdinkite nurodytos grupės (įvedama klaviatūra) pirmūnų sąrašą (studento pavardė, vardas, pažymiai).

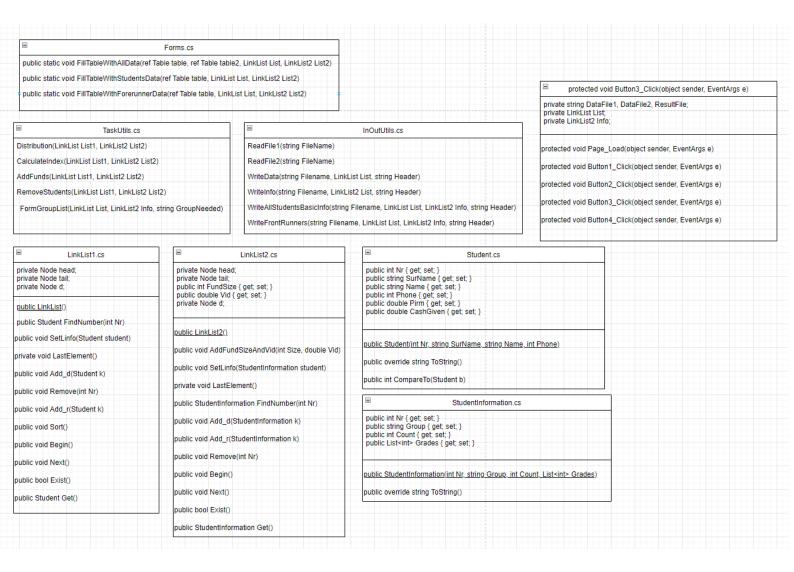

2.2. Grafinės vartotojo sąsajos schema

2.3. Sąsajoje panaudotų komponentų keičiamos savybės

Komponentas	Savybė	Reikšmė
FileUploader1	Get file	
FileUploader2	Get file	
Lable1	Text	"Studentų informacijos tvarkyklė"
Lable2	Text	"Studentų asmeniniai duomenys" // "Studentų sąrašas" // "Grupės " + TextBox1.Text + " pirmūnai"
Lable3	Text	"Studentų tarnybinė informacija" // "Sąrašas be studentų, kurie neturi stipendijos"
Lable4	Text	"* Failai/Failas, kurį pasirinkote tūrėjo neteisingą informacijos išdėstymą" // "* Failai/Failas, kurį pasirinkote buvo neteisingo formato !!! Bandykite dar kartą." // "* Parašėte neteisingą grupės formatą !!! (Grupės sudarytos iš vienos raidės)"
Lable5	Text	"Pasirinkite studentų asmeninių duomenų failą"
Lable6	Text	"Pasirinkite studentų tarnybinių duomenų failą"
Button1	Text	"Load Data"
Button1	OnClick	Pavaizduoja pradinius duomenys Label1 ir Label2 lentelėse.
Button2	Text	"Calculate schoarships"
Button2	OnClick	Prideda pirmūnų stipendijas, parodo Labell visus studentus su stipendijomis ir be jų, o Label2 parodoma visus studentus su stipendijomis.
Button2	Visibility	False
Button3	Text	"Make List By Group"
Button3	OnClick	Po to, kai įrašytas norimos grupės pavadinimas, į Labell pavaizduojama toje grupėje esančių studentų informacija.
Button3	Visibility	False
Button4	Text	"Reset To Main Page"
Button4	OnClick	Grįžta į pradinį puslapį
Button4	Visibility	False
Table1	GridLines	
Table2	GridLines	
TextBox1	Get string	Gauna studentų grupę

2.4. Klasių diagrama

2.5. Programos vartotojo vadovas

Paleidžiama programa. Kairėje esančiame failo pasirinkimo lauke pasirinkate failą, kuris tūrėtų asmeninę studentų informaciją.

Failo eilutės struktūra: Studento numeris sąraše, pavardė, vardas, telefono numeris.

Dešinėje esančiame failo pasirinkimo lauke pasirinkite failą, kuris tūrėtų tarnybinę studentų informaciją.

Failo struktūra:

Pirmoje eilutėje: stipendijų fondas, pažymių vidurkis norit gauti stipendiją.

Kitų eilučių struktūra:

Studento numeris sąraše, grupė, pažymių skaičius, pažymiai.

Pasirinkus failus galite spausti mygtuką "Load Data", kad pamatytumėte failuose esančius duomenis. Po mygtuko paspaudimo atsiras sekantis mygtukas "Calculate scholarships" šio mygtuko paspaudimu, bus sudarytos dvi lentelės.

Kairėje bus rodomi visi studentai su savo duomenimis ir jiems skirtomis stipendijomis.

Dešinėje bus rodomi tik studentai su savo duomenimis, kurie gavo stipendiją.

Viršutinėje dalyje atsiradusiame rašymo lauke galima įrašyti norimos pirmūnų grupės pavadinimas (Grupės sudarytos iš vienos didžiosios raidės). Įrašius norimą grupę ir paspaudus mygtuką "Make List By Group", bus rodomi tik toje grupėje esantys pirmūnai.

Paspaudus paskutinį mygtuką "Reset To Main Page", grįšite į pradinį puslapį.

Calculate scholarships

Testas Nr. 2:

Tikslas: Parodyti programos veikimą, kai failuose nėra duomenų.

U14a.txt
U14b.txt

Results.txt (Rezultatų failas nebuvo sukurtas)

2.8. Dėstytojo pastabos

3. Bendrinės klasės ir testavimas (L3)

3.1. Darbo užduotis

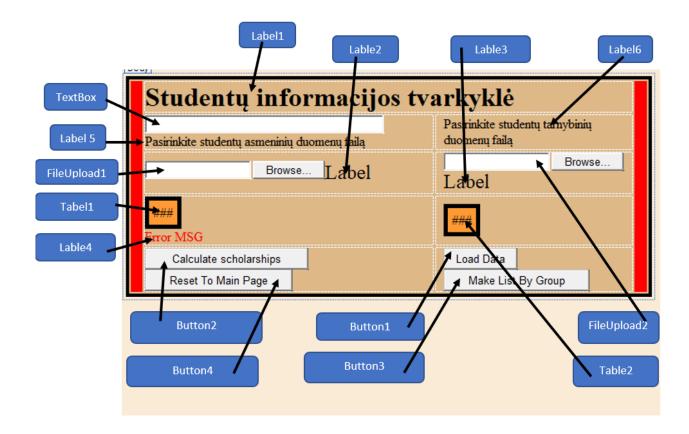

LD_14. Stipendijos. Studentų stipendijoms yra skiriamas nurodyto dydžio fondas. Studentui skiriama stipendija, jei jo pažymių vidurkis viršija nurodytą dydį ir jis neturi skolų (visi pažymiai >4). Studentui skiriama 10% didesnė stipendija, jei jo visi pažymiai didesni už 8. Toks studentas vadinamas pirmūnu. Paskirstykite studentams stipendijas pagal duotą fondą. Fondą reikia maksimaliai išnaudoti, bet negalima viršyti fondo dydžio.

Duomenys:

- Tekstiniame faile U14a.txt duoti studentų asmeniniai duomenys: studento eilės numeris, pavardė vardas, telefono numeris.
- Tekstiniame faile U14b.txt pateikta studentų tarnybinė informacija. Pirmojoje failo eilutėje nurodytas stipendijų fondo dydis ir pažymių vidurkis stipendijai gauti. Tolimesnėse eilutėse tokia informacija: studento eilės numeris, kuris sutampa su eilės numeriu U14a.txt faile, grupė, pažymių kiekis, pažymiai.

Spausdinamas sąrašas (studento pavardė, vardas, pažymiai, stipendijos dydis) turi būti surikiuotas pagal stipendijų dydį, pavardes ir vardus. Iš sąrašo pašalinkite studentus, kurie negauna stipendijos. Sudarykite ir atspausdinkite nurodytos grupės (įvedama klaviatūra) pirmūnų sąrašą (studento pavardė, vardas, pažymiai).

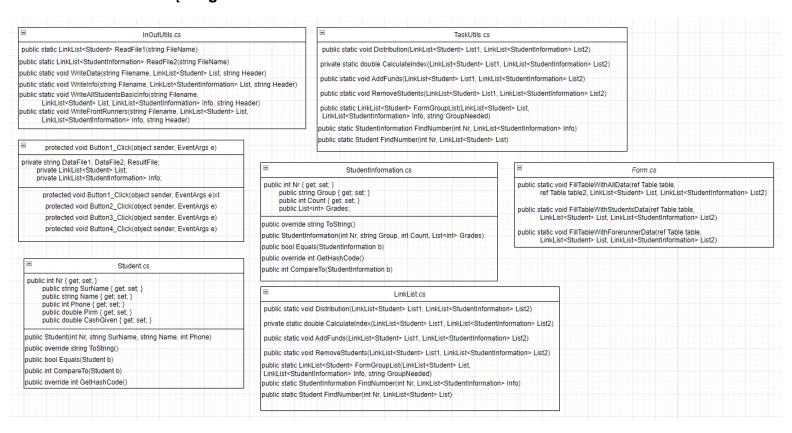

3.2. Grafinės vartotojo sąsajos schema

3.4. Klasių diagrama

3.5. Programos vartotojo vadovas

Paleidžiama programa. Kairėje esančiame failo pasirinkimo lauke pasirinkate failą, kuris tūrėtų asmeninę studentų informaciją.

Failo eilutės struktūra: Studento numeris sąraše, pavardė, vardas, telefono numeris.

Dešinėje esančiame failo pasirinkimo lauke pasirinkite failą, kuris tūrėtų tarnybinę studentų informaciją.

Failo struktūra:

Pirmoje eilutėje: stipendijų fondas, pažymių vidurkis norit gauti stipendiją.

Kitų eilučių struktūra:

Studento numeris sąraše, grupė, pažymių skaičius, pažymiai.

Pasirinkus failus galite spausti mygtuką "Load Data", kad pamatytumėte failuose esančius duomenis. Po mygtuko paspaudimo atsiras sekantis mygtukas "Calculate scholarships" šio mygtuko paspaudimu, bus sudarytos dvi lentelės.

Kairėje bus rodomi visi studentai su savo duomenimis ir jiems skirtomis stipendijomis.

Dešinėje bus rodomi tik studentai su savo duomenimis, kurie gavo stipendiją.

Viršutinėje dalyje atsiradusiame rašymo lauke galima įrašyti norimos pirmūnų grupės pavadinimas (Grupės sudarytos iš vienos didžiosios raidės). Įrašius norimą grupę ir paspaudus mygtuką "Make List By Group", bus rodomi tik toje grupėje esantys pirmūnai.

Paspaudus paskutinį mygtuką "Reset To Main Page", grįšite į pradinį puslapį.

4. Polimorfizmas ir išimčių valdymas (L4)

4.1. Darbo užduotis

- **U4_14. Automobilių parkas.** Įmonė UAB "Strėlė" plečiasi ir atidarė naujus filialus. Pirmoje eilutėje yra miestas, antroje adresas, trečioje telefonas. Įmonės automobilių parką sudaro lengvieji automobiliai, krovininiai automobiliai ir autobusai. Sukurkite abstrakčiąją klasę "Transport" (savybės valstybinis numeris, gamintojas, modelis, pagaminimo metai ir mėnuo, atliktos techninės apžiūros data, kuras, vidutinės kuro sąnaudos (100 km)), kurią paveldės klasės "Car" (savybė odometro rodmenys), "Truck" (savybė priekabos talpa) ir "Bus" (savybė sėdimų vietų skaičius).
- Raskite geriausią transporto priemonę kiekvienoje grupėje, atspausdinkite jos gamintoją, modelį, valstybinius numerius ir amžių. Lengvasis geriausias nuvažiuota mažiausiai kilometrų, krovininis geriausias didžiausia priekabos talpa, autobusas geriausias daugiausia sėdimų vietų.
- Sudarykite visų benzinu varomų lengvųjų automobilių sąrašą, ekrane atspausdinkite jų valstybinį numerį, gamintoją, modelį, bei pagaminimo metus.
- Sudarykite kiekvieno filialo autobusų sąrašą, surikiuokite pagal pagaminimo metus ir gamintoją.
- Nustatykite kiekvienai transporto priemonei artimiausios techninės apžiūros datą, jei lengvajam automobiliui techninė apžiūra galioja 2 metus, kroviniam automobiliui metus, o autobusui pusę metų. Į failą "Apžiūra.txt" įrašykite tų transporto priemonių duomenis (transporto priemonių gamintojus, modelius, valstybinius numerius, techninės apžiūros galiojimo pabaigą), kurioms iki techninės apžiūros galiojimo pabaigos liko mažiau kaip 2 mėnesiai

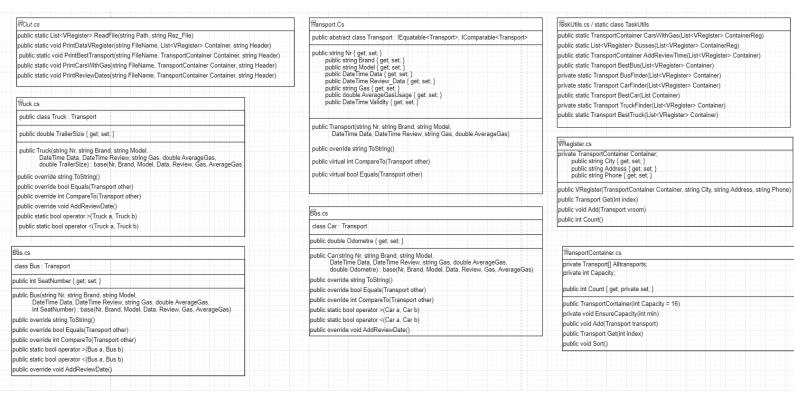

4.2. Grafinės vartotojo sąsajos schema

4.3. Sąsajoje panaudotų komponentų keičiamos savybės

Komponentas	Savybė	Reikšmė
Lable1	Text	"UAB "Strelė" įmonės transportų srašų tvarkyklė"
Lable2	Text	"Paspauskite mygtuką, kad pamatytumėte visas transporto priemones filiale." + "Geriausios transporto priemonės:" + "Visos mašinos, kurios naudoja benziną:" + "Visų filialų autobusų sąrašai:" + "Transporto priemonės, kurioms liko 2 mėn. arba mažiau iki technikinio:" + "Visos transporto priemonės:"

4.4. Klasių diagrama

4.5. Programos vartotojo vadovas

Failo struktūra:

Vienoje eilutėje einantys dydžiai, skiriami kableliais.

Faile aprašomas filialas, su jame esančiomis transporto priemonėmis (Priemones bus galima suskirstyti į 3 grupes, Transporto priemonės, kurių Valstybiniai numeriai prasideda raide "A" yra sunkvežimiai, prasidedantys raide "B" yra lengvosios mašinos, prasidedantys "C" yra autobusai.)

- Pirmoje eilutėje yra miestas
- Antroje adresas
- Trečioje telefonas

Tolimesnių eilučių struktūra:

- o Valstybinis numeris
- Gamintojas
- Modelis
- Pagaminimo metai ir mėnuo (atskiriami ,,/")
- Atliktos techninės apžiūros data (atskiriama "/")
- Kuras
- o Vidutinės kuro sanaudos (100 km)

Programos veikimas:

- 1. Paleidžiama programa. Kairiame kampe paspaudus mygtuką pavadinimu "Button" ant ekrano atsiras iš visų filialų nuskaitytų transporto priemonių duomenys.
- 2. Spaudžiant naujai atsiradusį mygtuką "Button" Ektrane bus parodomos geriausios transporto priemonės savo grupėje. Lengvasis geriausias nuvažiuota mažiausiai kilometrų, krovininis geriausias didžiausia priekabos talpa, autobusas geriausias daugiausia sėdimų vietų.
- 3. Spaudžiant mygtuką dar kartą, bus sudarytas ir atspausdintas sąrašas su visomis lengvosiomis mašinomis, kurios naudoja benziną, kaip kurą.
- 4. Spaudžiant dar kartą, bus sudarytas kiekvieno filialo autobusų sąrašas ir atspausdintas į ekraną.
- 5. Paspaudus dar kartą, bus sudarytas sąrašas automobilių, kuriems greičiau nei per 2 mėnesius reikės atlikti technikinę peržiūrą.
- 6. Paspaudus mygtuką dar kartą, programa pradės skaičiavimus iš naujo.

Visi atsakymai ir sąrašai bus atspausdinti į "Results.txt" failą, taip pat sąrašas automobilių, kuriems greičiau nei per 2 mėnesius reikės atlikti technikinę peržiūrą, bus atspausdintas į failą "Apžiūra.txt".

5. Deklaratyvusis programavimas (L5)

5.1. Darbo užduotis

LDD_14. Knygynai. Knygynų tinklo "Pegasas" knygynų knygų asortimentai surašyti atskiruose failuose: pirmoje failo eilutėje knygyno pavadinimas (failų daug), toliau kiekvienai knygai skiriama po vieną eilutę: knygos autorius, pavadinimas, leidimo metai, kaina, parduotų egzempliorių skaičius, likusių neparduotų egzempliorių skaičius. Atskirame faile įrašyti knygų atrinkimo kriterijų rinkiniai. Jų gali būti daug. Vieną kriterijų rinkinį sudaro leidimo metų intervalas (nuo-iki) ir ribinė tinkama pirkimo kaina. Vienas rinkinys užima vieną failo eilutę. Suformuoti knygų, tenkinančių atrankos kriterijus, sąrašus kiekvienam kriterijų rinkiniui atskirai. Sąrašų elementus surikiuoti pagal pavadinimą ir populiarumą. Kiekviename iš sąrašų suskaičiuoti kainų reikšmių vidurkį. Sudarykite sąrašą knygų, kurių kaina mažesnė arba didesnė (pasirinkimas per vartotojo sąsają) už sąrašo vidurkį.

Tabel1	GridLines	
DropDownList1	List	

5.4. Klasių diagrama

5.5. Programos vartotojo vadovas

Pirmiausia, norint, jog programa galėtų daryti savo skaičiavimus, reikia sukurti keletą failų. Pirmieji failai turės visą informaciją apie kiekvieną parduotuvę "Pegasas". Jų gali būti daug.

Failo struktūra:

Pirmoje failo eilutėje yra parduotuvės pavadinimas.

Sekančiuose eilutėse yra, kiekvienos knygos esančios šioje parduotuvėje duomenys.

Eilutės struktūra:

Knygos autorius, pavadinimas, leidimo metai, kaina, parduotų egzempliorių skaičius, likusių neparduotų egzempliorių skaičius. (Visi šie dydžiai skiriami kableliais, be tarpų)(Data skiriama "/" tarp metų, mėnesių ir dienų).

Kai turime susikūrę šiuos failus, mus reikia sukurti dar vieną failą, pavadinimu: "Collections.txt". (Atskiras failas, tik vienas). Šiame faile bus laikoma kriterijais, pagal kuriuos bus sudaromi rinkiniai.

Failo struktūra:

Failą sudaro eilutės, su kriterijais.

Eilutės struktūra:

Metų intervalas (nuo-iki) ir kaina (nuo-iki). Visą eilutę sudaro 4 dydžiai, kuriuos skiria kableliai(Metus, dienas ir mėnesius skiria "/").

Kai turime sukūrę ir sukėlę failus, galime paleisti programą..

Programos veikimas:

Programa gan paprasta. Paspaudus pirmąjį mygtuką, bus atspausdinti pradiniai duomenys į ekraną. Sekantis mygtukas atspausdint sudarytus rinkinius pagal kriterijus iš kriterijų failo. Tada ekrane atsiras išlendantis pasirinkimo laukas, kurio pagalba galėsite pasirinkti ar bus spausdinamos knygos, kurių kaina viršija vidurkį, ar kurių kaina yra mažesnė už kainų vidurkį.

Paskutinis mygtukas sugražins į pagrindinį svetainės puslapį.

Visi skaičiavimai ir informacija bus išsaugota "Results.txt" faile.
